

Best in cloud flexibility & ecosystem extensibility

VIDEO TRANSCRIPT

Thanks for exploring the Accenture Life Insurance & Annuity Platform or ALIP.

We'll show you how cloud and APIs enable today's functionality and tomorrow's innovation, whether you build your own capability or connect to it through your partner network.

Let's get started ...

Like most insurers, you manage complex insurance products across multiple lines of business.

You probably have multiple policy administration systems and a host of third-party connections too.

So you need flexibility. That's where cloud can help.

In this demo, we'll show you how ALIP can accelerate cloud adoption without compromising the functionality you need to manage the complexities of life insurance and annuities.

We'll also explain how ALIP's interface makes it easy for you to update and expand your network of third-party providers with its Interface Exchange library of industry-standard integrations and APIs.

With ALIP, moving to the cloud is a simple decision. That's because ALIP's code base is consistent, whether deployed, on-premise or in the cloud.

We've also decoupled applications, business processes and data, and containerized them into hybrid microservices that we call "macro" services.

This means you can choose the services you need, and where you want to deploy them — on premise, cloud or both — and we'll make sure they communicate with each other.

ALIP's macroservices approach is cloud-agnostic. So you're not locked into a specific cloud vendor, and can transition to the cloud at your own pace. And because ALIP lets your existing and new business co-exist, you have less risk and

lower operating costs during your cloud transition.

Accenture makes all of this easy for you, by maintaining single accountability for the software and cloud platform. Plus, you gain our industry-recognized Accenture Cloud Platform and Accenture Security Operations Center, which includes additional client data protection for cloud.

Our advanced web techniques mean you get a productive user interface... and our workflow-driven processes give you a flexible framework to define and customize business solutions. We also provide a message-oriented execution that lets you scale easily, and that exposes all services to real-time requests.

What's more, you can use low-cost commodity middleware, because ALIP's architecture is decoupled, componentized and pure-Java platform neutral.

Whether you deploy ALIP in the cloud or on-premise, your partner network is ready to plug and play.

Simply select the interface or API from our ever expanding library called the ALIP Interface Exchange.

It's one of our macroservices, and it lets you exchange real-time information quickly and seamlessly with systems that rely on data from ALIP.

Each interface is prebuilt and production-tested, making it easy for you to update or expand your partner network.

Interface Exchange includes an extensive library of interfaces that are ready out-of-the-box, or configurable if you're looking for something more specialized.

With the power of cloud and ecosystem connectivity, you can operate more easily and with greater agility: expand distribution channels, enter new markets, automate business operations and more!

Contact us to learn how you can accelerate your digital business with ALIP.
